Chapter 1

Basic Classes of Functions

Checkpoint Solution

Checkpoint 1.18: Evaluating Trigonometric Functions

Instruction

   (a) Evaluate $cos(3\pi/4)$.

   (b) Evaluate $sin(-\pi/6)$.

Solution

   (a) We start by sketching an unit circle with the angle $3\pi/4$, see figure 1.1. We know that $cos(3\pi/4)$ is defined to be the x-coordinate of the point sketched on the unit circle.

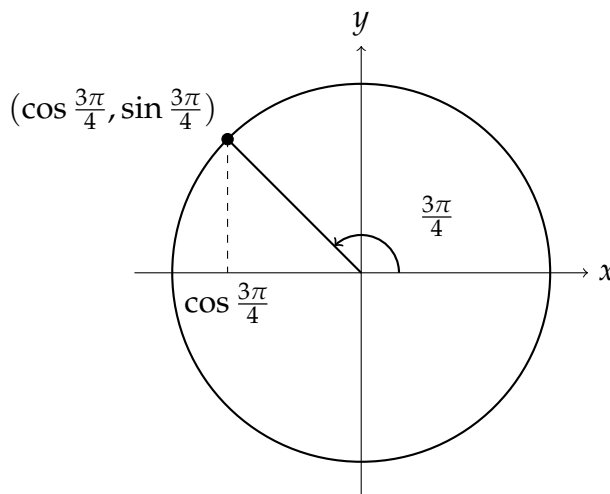

Figure 1.1: Unit circle with point at angle $3\pi/4$

There is a table with cosine values in given in the book that this exercise is taken from, but it only covers values from the first quadrant and our angle is in the third quadrant. But we can find the supplementary angle to our angle that will be $\pi - 3\pi/4 = \pi/4$ as shown in figure 1.2.

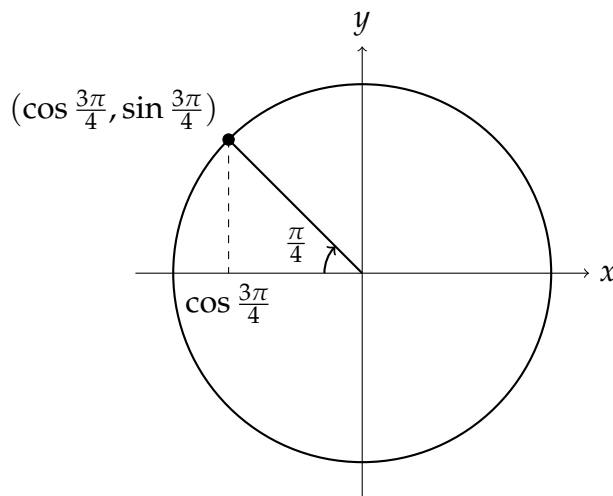

Figure 1.2: Unit circle with point at the supplementary angle $\pi/4$

We know from the table of cosine values given in the book that $cos(\pi/4) = \sqrt{2}/2$. It follows that we value that we are looking for will be the same but negative since our angle is mirrored in the y-axle. We conclude that $cos(3\pi/4)$ equals $-\sqrt{2}/2$.
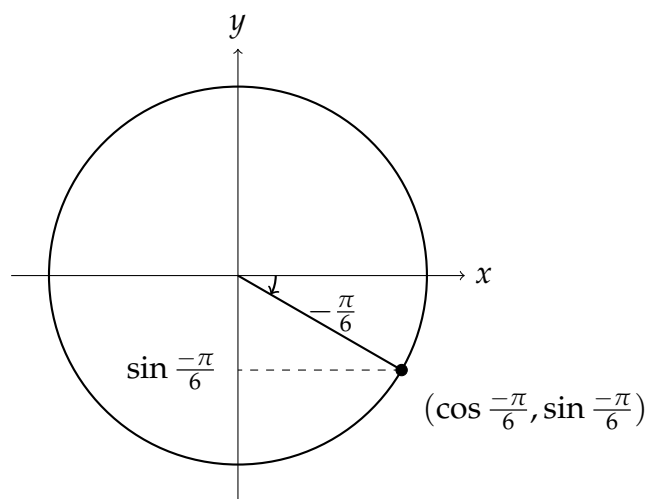

(b) TODO

Answer

(a) $cos(3\pi/4) = -\sqrt{2}/2$.

(b)

Figure 1.3: Unit circle with point at angle $-\pi/6$
